

# Get CRM objects (/v2/crm/entities)

GET /v2/crm/entities

This API is for use in the development phase only, to manually verify that objects are uploaded and processed correctly in Gong.

Returns a JSON object where each key is the object's crm id and the corresponding value is a nested JSON object representing the CRM object fields. Each key in the nested JSON is the field name and the corresponding value is the field value.

The objects are fetched from the Gong main DB. If the object is not found, the JSON's value is null.

The request body contains an array of objects ids.

The request is limited to 100 objects. If more than 100 objects are requested only the first 100 are returned.

When accessed using a bearer token, this endpoint requires the 'api:crm:get-objects' scope.

## Example

### Request

GET https://api.gong.io/v2/crm/entities?integrationId=6286478263646&objectType=DEAL

["1234","8765"] //request body

### REQUEST

#### QUERY-STRING PARAMETERS

|                                               |                                                                                         |
|-----------------------------------------------|-----------------------------------------------------------------------------------------|
| <div>*integrationId<br/>int64</div>           | Integration ID generated when creating the integration                                  |
| <div>*objectType<br/>enum</div>               | <b>Allowed:</b> ACCOUNT   CONTACT   DEAL   LEAD<br>Requested objects type               |
| <div>*objectsCrmIds<br/>array of string</div> | <b>Request Body:</b> The requested objects crm ids (should be sent in the request body) |

### RESPONSE

- 200
- 400
- 401
- 429
- 500

Successfully retrieved requested objects data

MODEL      EXAMPLE

application/json

#### OBJECT

Single line description

```
{
  requestId: string
  crmObjectsMap : {...}
}
```
